Benchmark Charts

Harrington's Insights: benchmark charts, standard compressors against the author's originals, modified tools and mutants. Assembled 29 October 2026 from recorded results; one run per tool per file, and every result was decompressed and checked byte for byte when it was recorded.

Classes. Standard: the stock tool. Original: the author's own designs (HCM, hcmx, Harrington Exchange). Modified: a tuned encoder whose output the stock decoder reads unchanged (bzip2-hi, xz-hi). Mutant: an existing compressor whose decoder was changed (lpaq1-h, the Exchange->Blosc2 hybrid, Exchange->xz).

Sets follow Andrew Goodwin's review: the Canterbury corpus, the first 1 MB of each Silesia file, and his synthetic set; plus the author's biased packed-data set and six radio captures from earlier runs.

How to read the dot charts. Each dot is one tool's total over a set. Up and down is size (lower is smaller); left to right is speed in MB of original data per second on a log scale (further right is faster). The dashed line joins the tools that nothing else beats on both size and speed; dots with a dark ring sit on it. Our tools are drawn larger with bold labels. The line charts show each file separately.

Data sources. All three of Goodwin's sets were run fresh, one run of all 14 tools per file on the same machine (29 Oct 2026), so speeds compare directly. Peak memory is the highest of compression and decode across the set's files.

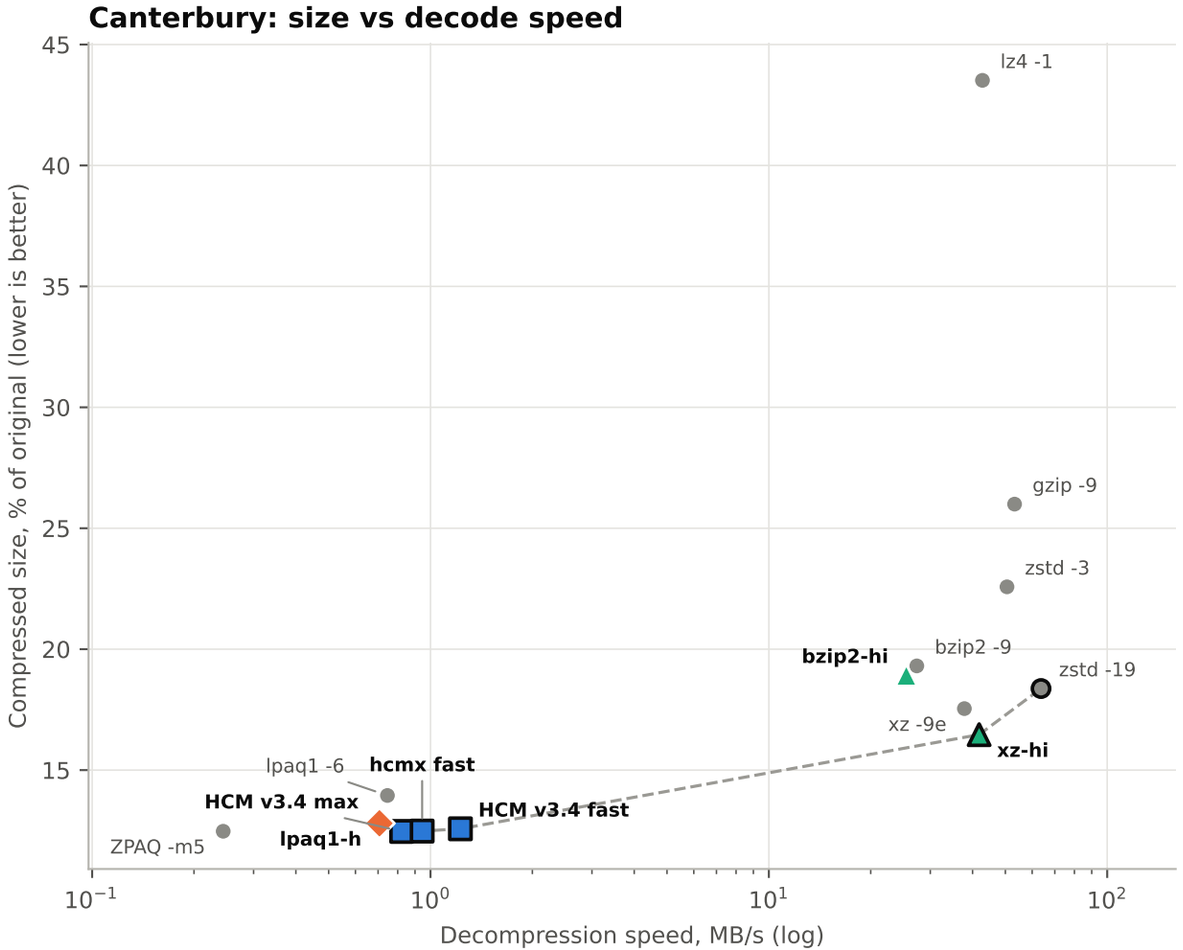

Timing notes. Times are wall clock including program start-up, so on small files the fast tools all look about the same; sizes are exact. lpaq1-h's compression time is the sum of its six tries (it keeps the best). ZPAQ sizes have its 1,015-byte per-file archive header removed, as in Goodwin's review. On the biased and radio sets decode times are earlier in-process measurements and compression times were mostly not recorded, so those two sets have decode charts only; ZPAQ's radio decode time is an estimate.

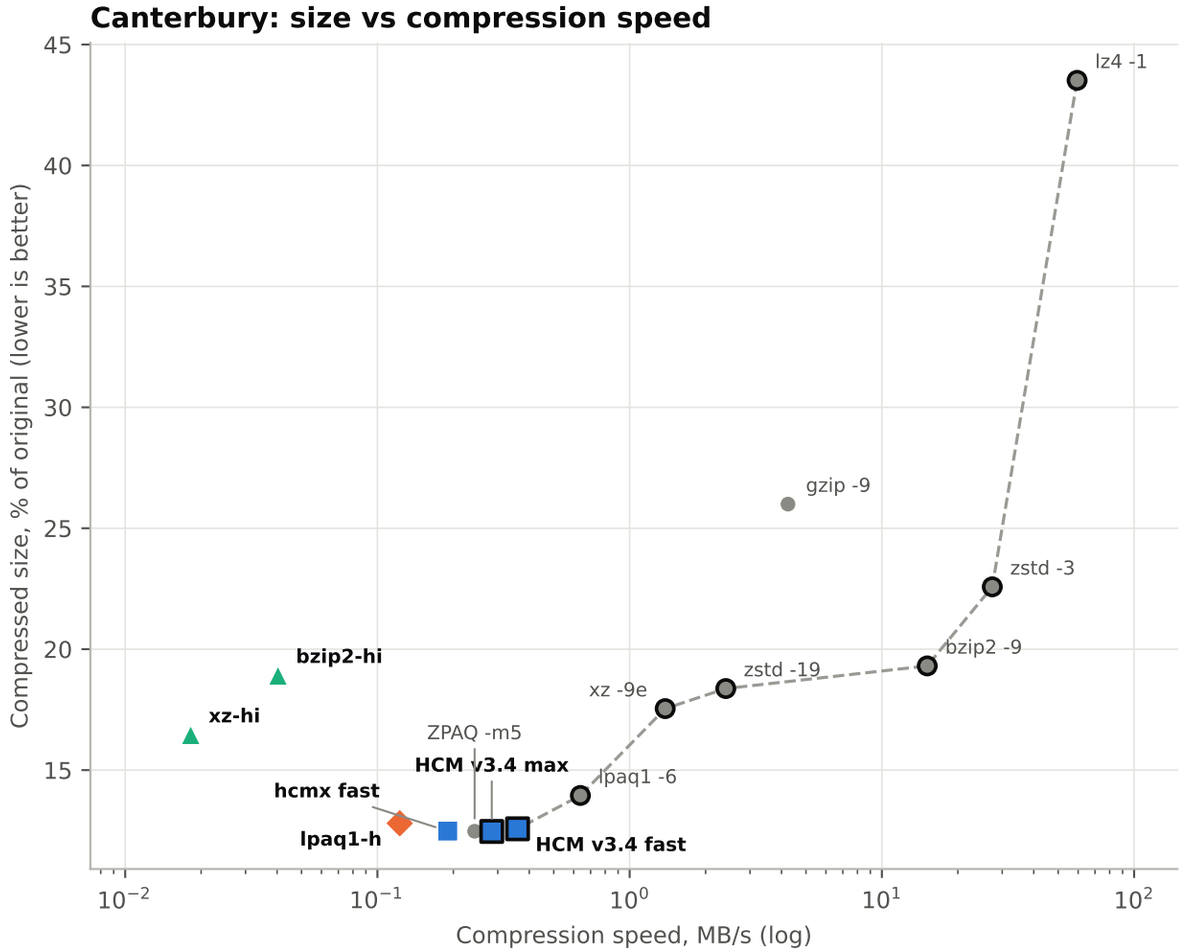

RESULTS

Canterbury (2,810,784 bytes, 14 tools). Smallest overall: HCM v3.4 max at 350,326 bytes. Best standard: ZPAQ -m5 at 350,542. Our best: HCM v3.4 max at 350,326 bytes (-0.06% vs best standard). Ours on the decode-speed trade-off line: HCM v3.4 max, hcmx fast, HCM v3.4 fast, xz-hi. Smaller AND faster to decode: xz-hi beats bzip2 -9, xz -9e; HCM v3.4 fast beats lpaq1 -6; HCM v3.4 max beats lpaq1 -6, ZPAQ -m5; hcmx fast beats lpaq1 -6.

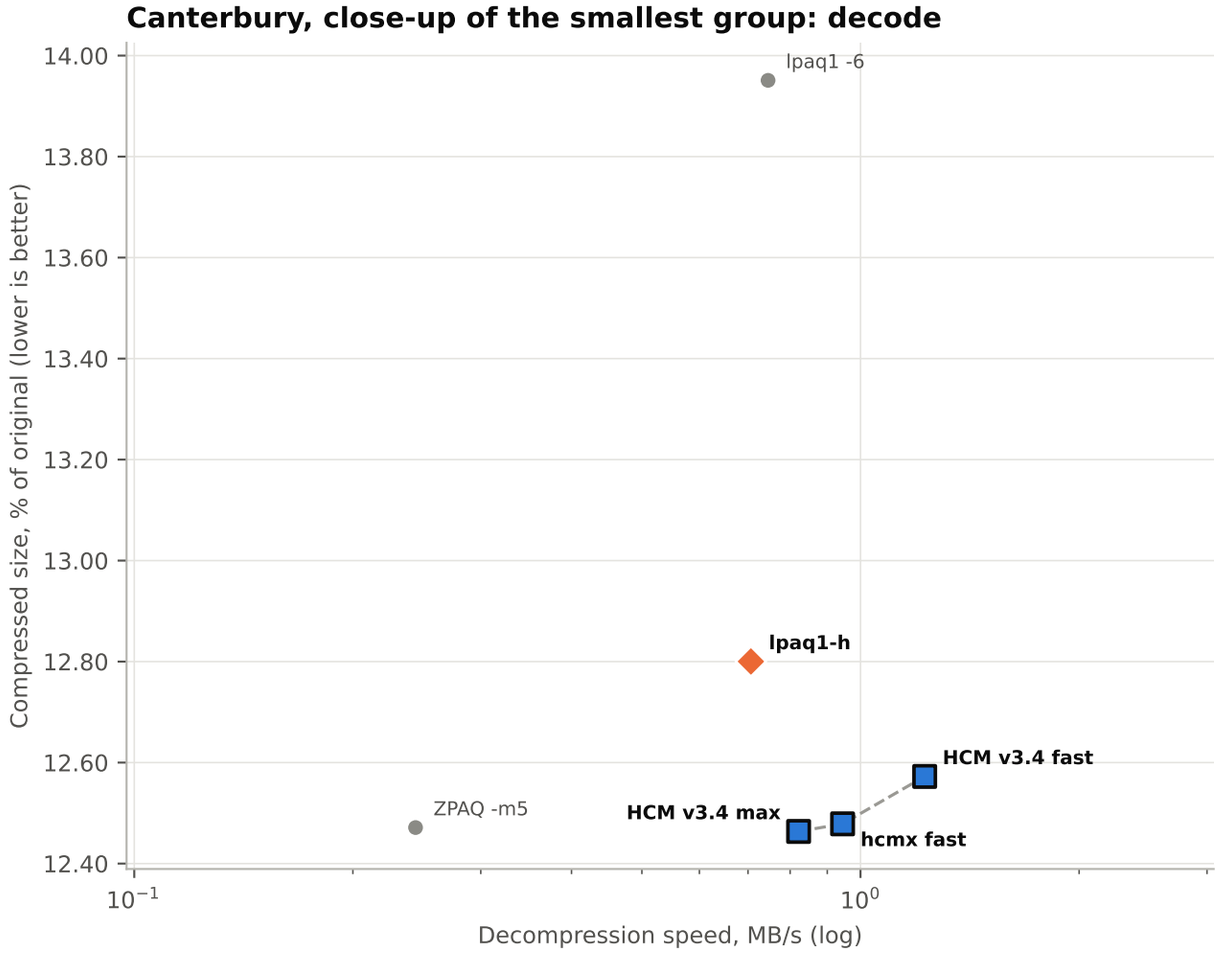

Silesia 1 MB sample (12,582,912 bytes, 14 tools). Smallest overall: ZPAQ -m5 at 3,418,919 bytes. Best standard: ZPAQ -m5 at 3,418,919. Our best: HCM v3.4 max at 3,544,604 bytes (+3.68% vs best standard). Ours on the decode-speed trade-off line: HCM v3.4 max, HCM v3.4 fast, xz-hi. Smaller AND faster to decode: bzip2-hi beats bzip2 -9; xz-hi beats bzip2 -9, xz -9e; HCM v3.4 fast beats lpaq1 -6.

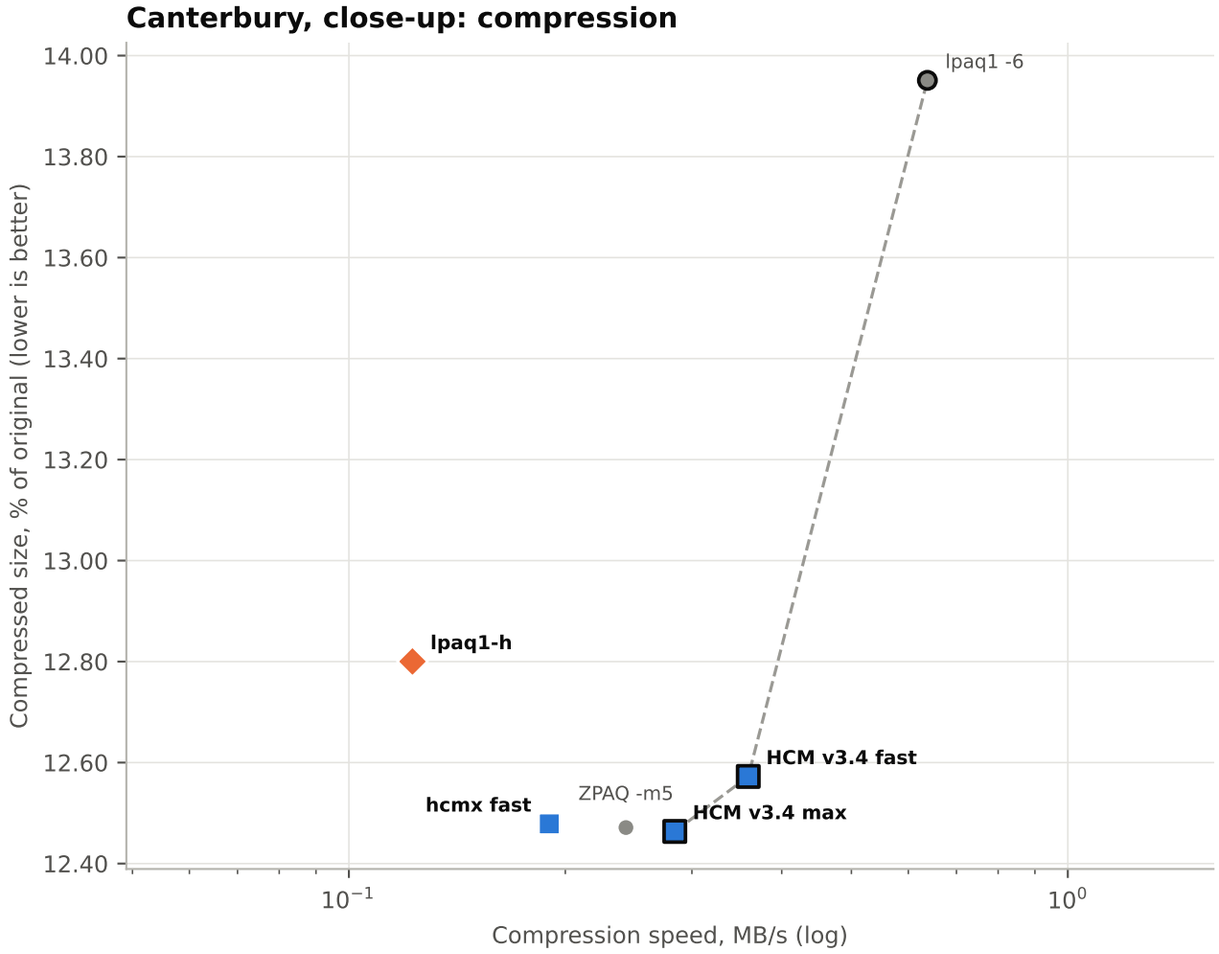

Synthetic set (17,999,934 bytes, 14 tools). Smallest overall: lpaq1-h at 8,113,745 bytes. Best standard: ZPAQ -m5 at 8,201,855. Our best: lpaq1-h at 8,113,745 bytes (-1.07% vs best standard). Ours on the decode-speed trade-off line: lpaq1-h, HCM v3.4 max, hcmx fast, HCM v3.4 fast, xz-hi. Smaller AND faster to decode: xz-hi beats bzip2 -9; HCM v3.4 fast beats lpaq1 -6, ZPAQ -m5; HCM v3.4 max beats lpaq1 -6, ZPAQ -m5; hcmx fast beats lpaq1 -6, ZPAQ -m5; lpaq1-h beats ZPAQ -m5.
